

GSE202642: original UMAP and a forced PGAM5-detection island

Same 12,135 cells in both panels; RNA detection = raw PGAM5 count > 0.

A. Saved expression-derived UMAP

B. Label-imposed schematic — NOT UMAP

● PGAM5 RNA detected (n=868) ● PGAM5 RNA undetected (n=11,267)

Right-panel separation is imposed by the detection label; it is not learned from expression similarity.
The artificial island provides no evidence of an independent subtype or a valid deconvolution signature.
